

What are Pheromones?

Pheromones are chemical compounds produced in humans and animals that result in other reactions in other people or perhaps animals. They are freed in order to stir up some sort of response which usually very often is sexual. Have you never noticed that a dog in heat may draw male dogs from seemingly out of nowhere? Hormones that are produced by the situation are usually discovered by the male canines who react while making love.

Pheromones are Released Mainly Through the Perspire Glands

They are mainly released from the crotch, underarms, and remaining hair. They may be released when the person or dog experiences frustration, fear, or surprise. They are also released by a ladies body when she is ovulating. This is the best time for reproduction and it is believed that these pheromones stir the sex drive in men.

Pheromones are usually detected by the [vomeronasal organ](#) so they are not discovered by olfactory glands like regular odors. They have no discernable odor so in that sense you can't compare them to fragrances.

Some manufacturers have said to provide these ingredients to perfumes and cologne fragrances. This may or not be true but the bigger question is; can these substances be synthetically produced, and if so can they work exactly like [natural pheromones](#)?

Perfume and cologne fragrances are really used to control the actions of people through causing them to have a favorable response to the fragrance. Fragrance can enhance mood so it is just natural with regard to pheromones to be added to all of them to increase sexual desire or perhaps attraction.

- The difference with pheromones is that they work by giving chemical triggers rather than physical triggers.
- Many perfume makers claim that when these compounds are added to perfumes that they will create a desired effect.
- That's not me so sure that the consequences of pheromones can be mimicked through attempting to duplicate the substances that they contain.
- Yes they work normally but mixing them with perfumes or colognes might make these ineffective.
- Then again it might make them more effective by working synergistically to improve the other person.

PheromonesNatural PheromonesChemical CompoundsPhysical

- We can successfully imitate them or extract them from folks we all can certainly use them eventually to create estimated actions.
- They are believed to impact sexual attraction, and actual fascination most of all.
- I believe that they also give us clues to the intentions of others.
- For example they could alert us to the fact that another person is suffering from dread, or frustration.
- The reason behind this is they are produced with adrenalin from these specific times.

Also believe that the amount and the intensity of pheromones produced by each individual differ depending on that personal body chemistry.

“ Pheromones can't be produced by perfumers so this is another excuse to be wary of ads regarding scents and colognes which are stated in order to contain these. Right now I am not saying that they do not include genuine, I am just saying that you have to be careful when you hear some types of claims promoted.

This is an Easy and Relatively New Area of Research

There are many things yet to be learned about the causes and effects of these chemical substances. As we increase all of us will eventually learn much more about how these chemicals work and that we will probably be able to control their potential to effect human being behavior.
